

## MO BACTER 5:5:20 + 3MgO

Viano Mo Bacter is an organic based fertiliser that contains a bacteria known as Bacillus sp. which eats dead organic matter known as thatch. The main feature of Mo Bacter is that it destroys moss without the use of chemicals or iron, and it will not need raking out once it dies. The moss is destroyed by overfeeding on potassium and as because it has a low tolerance of salts, it dies. Some of the dead moss will be picked up during mowing and the rest will be consumed by the Bacillus sp. eliminating the need to rake or scarify the dead moss out.

Lawns should be mown before application to allow the product to work its way to the soil. Application rate is 100-114g per sq.m between March and October. Leave for 7-10 days after application before lawns are mown again to avoid picking up the product.

The NPK fertiliser in MO Bacter stimulates new grass growth, helping to thicken grass, filling in where moss has died. It is also safe to animals and children, can be composted with clippings and will not stain hard surfaces or kill border plants if product spreads out of grass areas.

## MO BACTER INSTANT 1.5-0-6

Instant lawn tonic is a 100% organic plant feed and moss remover for lawns. It is applied with a sprayer or watering can at 2ltrs of product to 18ltrs water, which will treat 250sq.m between February and November – as long as there is no risk of frost.

Once applied, moss will die off within 24 hours and will require raking out once completely dead.

Instant Lawn Tonic is safe for children and pets, and clippings can safely be disposed of on compost heaps. Overseeding can be safely done once the dead moss has been removed.

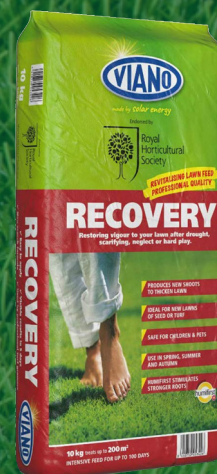

## RECOVERY 8:6:13 + 3MgO

Viano Recovery is an organic based fertiliser aimed at recovering grass from high stress periods such as weather, high wear or neglect. It contains a unique formulation of both humic and fulvic acids known as Humifirst, that encourages healthy, strong rooting, supporting the uptake of nutrients from the product and the soil.

Recovery is an ideal product to use 7-10 days before turfing or over-seeding a lawn used at the initial rate of 100g sq.m. and then 8 weeks later use at the maintenance rate of 50g sq.m to encourage thickening and giving a rich colour to your lawn. Apply in the growing season between March and October, it will not scorch the lawn after application but will require watering in.

Recovery is safe for children and pets as long as it's not eaten, and clippings can safely be disposed of on compost heaps.

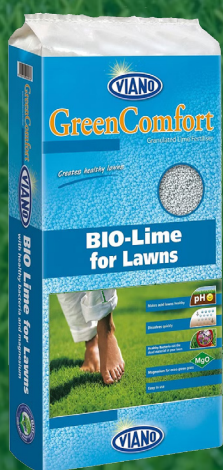

## BIO-Lime 9:3:3 + 3MgO

Bio-Lime is designed to raise the pH levels in soil. Low pH levels are known as acidic soils, which can happen naturally over time by using certain products, acid in rain or plant activity - some soils are just naturally acidic. By raising the pH, more nutrients become available to plants and moss coverage can be reduced.

Bio-Lime is a pelleted product and so easy to apply via a spreader at 50g sq.m. It contains a naturally occurring bacteria called Bacillus which will eat thatch when soil temperatures are above 5 degrees.

Bio-Lime is safe for children and pets as long as it's not eaten, and clippings can safely be disposed of on compost heaps.

## UNIVERSAL LAWN FEED 9:3:3 + 3MgO

Viano Universal Lawn Feed is made up of nitrogen, phosphate and potash + magnesium. This fertiliser is perfect for ensuring lawns are healthy and green throughout the growing season, giving the perfect lawn.

Universal Lawn Feed is an organic fertiliser made from a variety of naturally occurring materials. These release their nutrients gradually, giving your lawn a consistent feed over twelve weeks. The extra magnesium in this product gives grass a strong green colour.
